The Problem: Broken Trust in Feedback

- Surveys were meant to be private and authentic — but today they're data traps.

- They leak, get sold, attract bots, and are never truly anonymous.

- Current privacy aware solutions - web3 included - protect against external leaks, but not against insiders in possession of keys.

- After 14 years in research, we've seen how people hesitate to speak honestly.

- The result: polite data, no real insight.

- Without trust, organizations can't truly listen — and innovation stalls.

  Real insight only exists when people feel safe to be honest.

The Solution: S3ntiment

- A privacy-preserving Web3 survey experience that restores trust to feedback.

- Human Network's OPRF enables easy and secure onboarding.

- One card → one temporary wallet → one anonymous response.

- Results processed privately via Nillion's blind computation — no one sees the raw data.

- People speak freely — and organizations listen without risk.

- **Honesty becomes effortless — because privacy is built in.**

ANONYMOUS VOICES, AUTHENTIC INSIGHTS

RealFi Demo

- Live pilot at the CryptoArt Museum Amsterdam.

- Visitors scanned cards, onboarded in seconds, and shared feedback easily.

- Responses were processed privately.

- People described it as "easy, fun, and safe."

  We turned a live event into our demo. And it worked.

DON'T WORRY, BE HONEST

Potential impact

- The $4.5B global survey industry runs on fragile data protection and fading trust.

- As privacy laws tighten, the need for anonymous and authentic feedback grows.

- S3ntiment can power:

  - Event evaluations

  - Workplace culture & safety surveys

  - Public and academic research

- Creates fraud-proof, low-cost, human-centered feedback loops.

  Once surveys can be trusted, feedback becomes collective intelligence.
